

Where Our Device Behaviours Stand Now

Fogg's Model – problems reflected through behaviours

⚠ Replacing functional devices

Because motivation to upgrade is high, users treat novelty as a reason to replace rather than maintain.

⚠ Repair feels like extra effort

Because ability is low, repair, part swapping and alternative use cases are harder to access than buying new.

⚠ Sustainability is not a strong trigger

Environmental impact is often distant from the purchase moment, while marketing and FOMO are immediate.

⚠ The system rewards replacement

Trade-in and resale make disposal convenient, but do not necessarily keep the device in use longer.

High motivation to upgrade + low ability to sustain + weak sustainability triggers

→ opportunity: make keeping, repairing, reusing and responsibly passing on devices easier and more rewarding than replacing them.
