

Responsible AI Canvas

Identified the risks, limitations and opportunities of using AI to assess device condition and usability.

AI assesses condition and usability, but the final choice to donate, sell, keep, or refurbish belongs to the user.

Cases, covers, lighting, camera angle, and hidden damage can cause inaccurate assessments. The system must clearly state its limitations.

Brands, models, materials, and device conditions cause inconsistent assessments. The system needs regular testing and updates with new devices.

When used carefully, AI can make it easier to identify devices that can stay in use, be donated, refurbished, or resold, potentially extending product lifespans and reducing e-waste.
