

Sustainable User Mapping

Upgrading is driven by emotion, not just need

Rohit's existing devices are often still functional, but excitement, FOMO, tech trends and marketing encourage him to buy the newest model.

The old device becomes an afterthought

Once the new device is purchased, the old phone moves from being a valuable product to something that needs to be dealt with. This creates accumulation and clutter.

Trade-in is convenient, but the afterlife is unclear

Trading in the old device makes upgrading easier, but Rohit has little visibility into whether the device is reused, refurbished, resold or discarded.

Financial value can motivate responsible behaviour

Rohit responds strongly to value, discounts, trade-in offers and getting something back for his old technology. Sustainability can therefore be paired with a tangible financial incentive.

Convenience is critical to behaviour change

If responsible disposal requires multiple steps, users are likely to postpone it. The sustainable option needs to be as easy and immediate as buying or trading in a new device.

Trust is a major barrier

Rohit has concerns around personal data, the condition of refurbished devices and what happens to his old device after handing it over. Transparency can reduce this uncertainty.
